

How do you use (run/install) an AppImage?

AppImages do not need to be installed. They are a self-contained app that simply needs to be made executable and then run.

As nothing is actually installed, it is good idea to move the downloaded APPIMAGE file to a folder of your choice before creating any shortcut link to it. For my Fedora install I use `/usr/local/share/filename-directory`. If necessary I will also save the shortcut image here.

Download the AppImage and then make it executable as follows:

```
$ chmod a+x Filename.AppImage
```

Now run the application as follows:

```
$ ./Filename.AppImage
```

When first run, some AppImage applications will ask if a desktop shortcut should be created.

If a shortcut is not created, this can be done manually using your text editor of choice. In my Fedora install this is done here: `~/.local/share/applications/`
